

Exception Handling

- Try block

The try block will generate an exception, because x is not defined:

```
try:  
    print(x)  
except:  
    print("An exception occurred")
```

output

An exception occurred

- Raise an exception

To throw (or raise) an exception

```
x = -1  
if x<0:  
    raise Exception("Sorry, no numbers below zero")
```

Output

Sorry, no numbers below zero
